

**AQUACULTURE & FISHERIES CRSP PROPOSAL**  
**[ANTICIPATED] QUANTIFIABLE BENEFITS**

A discussion of anticipated benefits can focus on any identified target group. Please identify stakeholders, end users, others who may benefit from your work, and then propose a quantifiable measure for capturing the information. Qualitative information is important and can still be captured. However, for purposes of accountability to donors CRSP needs to report on quantitative indicators. Indicators are likely to be discussed in detail at the first planning meeting in Spring 2007 for winning proposals. By providing your best estimate of benefits now, peer-reviewers will be better able to assess the strengths of your proposal.

Please clearly state your proposed deliverables and schedule separately from this section on Quantifiable Benefits.

An important outcome of CRSP research is the positive economic impact that results from farmers adopting new technologies. While a given technology may maximize yields, others may yield higher profits. Also, research that benefits the greatest number of farmers will result in growth and development of aquaculture and increase the overall impact of the CRSP.

Section 2e. of each proposed investigation must be a statement describing the quantifiable anticipated economic or ancillary impacts of the research. Also, identify the primary beneficiaries of the information, technologies, or management practices developed by the project.
